

ABSTRACT OF THE DISCLOSURE

The disclosure relates to a dual-mode terminal for accessing to at least first radiocommunications network in a first operating mode and to at least one local communication network in a second operating mode. The dual-mode terminal includes means for detecting the presence of said terminal, at least according to location information related thereto, in a geographic service area associated with said second network, known as a positive presence, and means for connecting, in the case of said positive presence, to the second network in such a way that the terminal operates in priority in said second mode.
